Subj: Honeywell Smart Energy Oil meters with LCD display and integral 4-20mA output

Honeywell Smart Energy, including the legacy Elster AMCO Water, is pleased to announce the availability of our positive displacement fuel oil meters with LCD totalizer display and integral 4-20mA output. This applies to meters in sizes ½" – 2". The LCD version oil meters now provide the capability to directly display and output rate of flow signals (gph, L/h) without need of intermediate devices for converting pulse outputs. Our current versions continue to be offered. These include direct read, reed switch pulse, and inductive pulse models. Pricing for the LCD version is already included in current industrial pricing pages. Product specification sheets are still in production as of this release.

There is no change to the metrological performance, materials of construction, fit, or function for the product. Units of registration are field programmable among USG and Metric, meaning there is no differentiation for part numbers.

Retrofit register assemblies are not currently available.
